Engine Control Options

Engine from Emotion Systems comes as standard with three available control mechanisms

- Manual control, using Engine Configurator
- Watch folder control - 32 watch folders are now standard on all Engine purchases
- Client control from network attached computers. Four Eclient licences for network installation are included

Watch folders can be used with any workflow, including workflows that merge the contents of video and audio files, and those that create multiple output files. Watch folders include flexible file move and rename options.

Additionally Engine Pro also includes a flexible, REST based API for integration into third party tools. Integrations are available from a number of manufacturers including -

- Telestream
- Aspera
- SAM (Snell Momentum)
- Tedia
- TMD

An integration toolkit is available for those customers wishing to integrate Engine in a bespoke manner.

When using Watch folders, MAM or Client control, the included Status Monitoring tool provides real time updates on progress, as well as access to PDF reports for completed jobs. XML and CSV logs are also available for use with MAM and other tools.
